Age-Associated Financial Vulnerability: An Emerging Public Health Issue

Mark S. Lachs, MD, MPH, and S. Duke Han, PhD

Various processes common in the aging brain may affect an older adult’s ability to manage personal finances, the most recognized of which are dementing illnesses (1). These conditions can affect cognitive abilities, which may jeopardize an older adult’s financial well-being over their longitudinal course. However, recent studies suggest that even cognitively intact older adults can have “functional” changes that may render them financially vulnerable. Social isolation also increases dramatically with age, which places older persons at risk for exploitation from predators. Furthermore, capitalistic enterprises can threaten the financial security of this group, which is perceived to be a large untapped market and, in an era of information overload, is often presented with a dizzying array of products and services.

We propose the concept of age-associated financial vulnerability (AAFV) and discuss aspects of its epidemiology from the vantage of a neuropsychologist (S.D.H) and geriatrician–epidemiologist (M.S.L) who are both researchers and clinicians working in the field of elder abuse. We believe that considering AAFV a clinical syndrome may be advantageous to further critical research, promote public policy work, and encourage physicians to recognize it.

Epidemiology of AAFV: Prevalence and Risk Factors

Although a precise determination of the prevalence of AAFV would require assessment of a large population-based sample of older adults, community-

National Center on Elder Abuse

As a national authority, the National Center on Elder Abuse (NCEA) is a provider of up-to-date, pertinent and valuable resources, education, and information on elder abuse and neglect. The NCEA disseminates information and provides technical assistance and training by: making news and resources available, collaborating on and disseminating research, identifying information about promising practices and interventions, operating a listserv, and providing subject matter expertise.

The Department of Family Medicine and Geriatrics at the Keck School of Medicine of USC was named the sole grant recipient to become the National Center on Elder Abuse (NCEA) from September 2017 – August 2020. The NCEA is led by Laura Mosqueda, MD, and a team at the Keck School of Medicine in collaboration with the USC Davis School of Gerontology, the American Bar Association and other organizations dedicated to supporting an aging America. For the latest reported statistics and data on elder abuse, please here. To find out about student opportunities, please click here.
Elder abuse can be defined as "a single, or repeated act, or lack of appropriate action, occurring within any relationship where there is an expectation of trust which causes harm or distress to an older person". Elder abuse can take various forms such as financial, physical, psychological and sexual. It can also be the result of intentional or unintentional neglect.

The Finance, Cognition, and Health in Elders Study: Toward Preventing Financial Exploitation of Older Adults

by Gali H. Weissberger and S. Duke Han

February 28, 2018

Why is financial exploitation so common in the elderly population? Why do some older adults fare better than others when making financial decisions? What factors protect or place one at greater risk of being financially exploited? These are just some of the questions that a multidisciplinary team of investigators hope to answer through the Finance, Cognition, and Health in Elders Study (FINCHES) being carried out through USC’s Department of Family Medicine.

**ABSTRACT**

**Objectives:** Financial exploitation (FE) in old age is poorly understood, particularly among those without significant cognitive impairment. The Finance, Cognition, and Health in Elders Study (FINCHES) aims to identify factors associated with FE among cognitively-healthy older adults. Preliminary findings regarding physical and mental health correlates in the pilot phase of FINCHES are reported.

**Method:** Sixteen older adults who self-reported FE were demographically-matched on age, education, sex, and race/ethnicity to eighteen older adults who did not report past FE.

**Results:** Those who believed they were exploited endorsed significantly greater symptoms of depression (\(p = 0.014\)) and marginally greater symptoms of anxiety (\(p = 0.062\)). Participants trended towards lower perceived successful aging (\(p = 0.094\)). Perceived FE participants also endorsed greater medical conditions (\(p = 0.047\)), but follow-up individual item analyses suggest that this was driven by problems with sleep (\(p = 0.030\)).

**Conclusions:** These preliminary findings from the pilot phase of FINCHES highlight negative mental health factors associated with perceived FE among cognitively-intact older adults.

Who's Most Likely to Scam a Senior? The Answer May Surprise You
Aug. 30, 2019

BY ROBERT PREIDT, HealthDay Reporter

FRIDAY, Aug. 30, 2019 (HealthDay News) — As people age and their mental capacities decline, they can often be targeted by scammers seeking easy cash.

WHEN THE WORLD STOPS

WHAT TO KNOW AND DO ABOUT THE GLOBAL PANDEMIC

STAMFORD, CONN.

Cheryl Christopher, 57, in self-quarantine at home after she was confronted with COVID-19 in a birthing center.

The nurse noticed that she tested positive on March 17.
COVID-19 and Elder Abuse
(mostly anecdotal so far)

• The Federal Trade Commission (FTC) put out two warnings, one in March and one in April, about an increase in COVID-related scams. These included malware in the form of emails from the CDC or WHO, fraudulent vaccines or treatments, or fake charities.

• We know domestic violence rates increased in China and Spain, and older adults were involved in some of those stories.

• The CEO of a Canadian organization for seniors called CanAge reported a 10-fold increase in elder abuse reports in April.

• An international organization called HelpAge reported disproportionate increases in elder abuse during the pandemic in places like Nepal, Democratic Republic of Congo, Jordan, and Kyrgyzstan.
- **Vulnerable Older Adult**
  - Particularly vulnerable to COVID-19
  - Social isolation and greater dependency on others
- **Trusted Other**
  - Shuttering of adult daycare programs, senior centers, and outpatient programs
  - Opportunistic others taking advantage
- **Contextual Factors**
  - Ageism
A global trend

Duke Han, who researches elder abuse at the University of Southern California, noted a “massive increase in reports of elder abuse during the pandemic,” in a paper released in April — based on anecdotal reports of surges. He describes this uptick as unsurprising.

The National Center on Elder Abuse says social isolation is one of the greatest risk factors for elder abuse and since it is reported far and wide, the coronavirus pandemic is a breeding ground for social isolation.

“We also know that the pandemic has created greater dependency of older adults on others, which might be exploited by abusers.”

Elder abuse appears to be climbing during the pandemic, experts say

By Grace Birnstengel, Next Avenue

Nation Jun 23, 2020 11:52 AM EST
In a COVID-19 context that promotes physical distancing, older people in isolation and especially those with cognitive decline/dementia may become more anxious, angry, stressed, agitated, withdrawn and overly suspicious during the outbreak and while in quarantine (Social Care Institute for Excellence, 2012; IASC, 2020; NICE 2015; Wang et al., 2020). In addition, emerging evidence is also showing a rise of abuse towards older people. Before the pandemic, it was estimated that 16% of older adults over 60 were affected by some form of abuse (Yon et al., 2017; 2019). That number was even higher for at-risk individuals, including people with physical or mental disabilities and people living in LTC facilities (Storey, 2020). Since the pandemic began, it is believed that abuse towards older people has risen as much as tenfold (CTV, 2020). This has occurred in the community, in institutions such as residential and nursing care facilities for older people, and online, with a surge in scams directed at older people. Lockdown and “stay-at-home” orders, likely to last longer for older people, are fuelling precisely those factors which put older people at risk of violence (Storey, 2020): even greater social isolation, more mental health problems, increased dependency on carers, more alcohol and substance abuse, and increased financial difficulties. Ageism, pervasive before the pandemic and a risk factor for violence against older people, has become worse during this pandemic which disproportionately affects older people (Han & Mosqueda, 2020) and gender inequalities have been compounded increasing risks of gender-based violence against older women (WHO, 2020g). The impact of the pandemic on institutions for older people, leading to staff reductions due to illness and suspension of family visits, is increasing the isolation of residents and the already high risk of violence (Gardner, States & Bagley, 2020). It is important for decision-makers therefore to take an active role in monitoring and preventing this violence. Equally important is the provision of resources to families to understand what constitutes abuse of older people and what the signs of it are.
Suggestions

• Family members and loved ones should regularly check in with older adults.

• Older adults should not be shy to reach out to supportive resources.

• If you experience a scam/fraud, report it to the authorities.

• Don’t get rushed into making a financial decision.

• Be more cautious about internet and online opportunities.

• Make sure your affairs are in order.

• Long-term goal: Addressing Ageism.
Resources

• 911 and local Adult Protective Services (APS)

• IC3: Internet Crime Complaint Center of the FBI (www.ic3.gov)

• U.S. Senate Special Committee on Aging Fraud Hotline (https://www.aging.senate.gov/fraud-hotline)

• Better Business Bureau Scam Tracker (https://www.bbb.org/scamtracker/reportscam)

• NCEA Resource Line: (855) 500-3537
Summary

• The COVID pandemic presents multiple threats, but also *multiple opportunities* to address elder abuse and neglect.

• Interventions for elder abuse during the pandemic may benefit from consideration of the AIM Model (Mosqueda et al., 2016):
  – Vulnerable Older Adult
  – Trusted Other
  – Contextual Factors

• We need more hard data on how the pandemic has impacted elder abuse and neglect.

• We need more input from aging experts on pandemic (pre-, during, and post-) policies.
